

REPORT DOCUMENTATION PAGE

The public reporting burden for this collection of information is estimated to average 1 hour per response, including gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

Final Report, July 2007

Peter Bradshaw (Emeritus Professor) P.I.

M.E. Dept., Stanford University

Stanford, CA 94305-3032

bradshaw@stanford.edu

Background

The purpose of this project was to examine the effect of surface roughness on a turbulent wall flow, in the limit of small roughness. It is, in effect, an attempt to throw light on experimental results dating from 1933, which appear to have been misinterpreted ever since as the result of an imprecise statement in the original (German) report by Nikuradse (a.k.a. Nikuradze) and its translations¹. It was stated that below a certain Reynolds number $u_\tau k/\nu$, based on the (sand-grain) roughness height k and the friction velocity u_τ , the roughness had "no effect" on the friction factor (i.e. no effect on the additive constant in the logarithmic law for velocity). All that can be deduced from the plotted results is that the effect became smaller than the experimental scatter, and there is no reason to suppose that the roughness effect depends on instability above some "critical" Reynolds number - particularly as later estimates of this Reynolds number are very low ($u_\tau k/\nu$ in the range of about 2 to 5).

The present author² produced an unrigorous but plausible argument that the roughness effect should vary as $(u_\tau k/\nu)^2$ in the limit of small roughness. Briefly, the Reynolds number that matters is likely to be that based on the mean velocity at the height of the roughness (nominally $k\tau_w/\mu$ if k lies within the linear part of the viscous sublayer) and on k itself, in which case it will vary as k^2 .

In order to manufacture surfaces with small roughness Reynolds number repeatably, a closed-loop pipe rig was constructed, to be run at static pressures below atmospheric (hence the name "Subpipe") to obtain low unit Reynolds numbers, so that physically-large roughness elements could be used. The practical application of the work is to the development of a more precise criterion for allowable roughness on (pressure) wind-tunnel models. Final hand polishing of a model is time-consuming and expensive, so unnecessarily fine polishing is to be avoided.

Present Position

The project has been dogged by "bad luck". Shortly after the test rig (20 ft long) was

completed, the P.I. had a bicycle accident, resulting in a broken hip, severe muscle damage and restricted mobility which has persisted to some extent. This delayed the start of experimental work for over a year. Then the rig was out of action for some time because it was inaccessible behind a wind tunnel being used for an unrelated experiment which lasted much longer than expected. Finally an alternative site was found, but it was found that the rig and its motor power supply had been damaged. Repairs took a long time, and the result is that no coherent results have yet been obtained.

The project's Stanford account has been closed. I have every intention of finishing this work: my general health remains good. Further expenditure will be borne by the P.I.'s personal Discretionary Fund.

Note

In my letter of 5 Dec. 2006 (attached) I requested a further extension of the grant, in view of the unavoidable delays to the project. Our contracts office passed on an oral message that this request was denied but I have never received written notification, so there may be a gap in somebody's files.
